# ***The scientific goal of ECCO is to understand and describe the general circulation of the ocean and its role in climate.***

## **Support and Partners**

- Supported by **Physical Oceanography, Modeling Analysis and Prediction (MAP)**, and **Cryosphere** programs
- Add'l NASA support: **OBB, CMS**
- Key U.S. partnerships: MIT, UT Austin, Atmospheric and Environmental Research (AER), SJSU/Moss Landing Marine Laboratory, UCSD/Scripps Institute of Oceanography

## **Two Cornerstone Applications**

- *State Estimates*: complete, physically-consistent, multi-decadal reconstructions of the full-depth, time-evolving global ocean, understanding ocean climate change:
- *High-Resolution Simulations*: cutting-edge ocean and coupled atm/ocean simulations that push technological and computational limits, process studies, S2S forecasting, mission formulation

# ECCO: Connections

*Connecting NASA Ocean, Cryosphere, and Biogeochemistry Data to Support National Climate Policy*

---

## Project Objectives

- Over the next five years, **we will extend the ECCO project to maximize the relevance, utility, and accessibility of ECCO products and tools to the scientific research community and policymakers on the national level.**
- To achieve these goals, we will engage in **research and technology development** to advance our adjoint ocean optimization machinery and **expand the scope of our state estimation** work to incorporate novel ocean, **cryosphere**, and **biogeochemical datasets** in partnership with domain experts in those communities.
- We will also make critical investments to expand and facilitate **discoverability, access, analysis, and reproducibility** of ECCO products in support of NASA Open Science Priorities.

# ECCO: Connections High-level Goals

*Connecting NASA Ocean, Cryosphere, and Biogeochemistry Data to Support National Climate Policy*

---

## Central State Estimates

- extend the start time back from 1992 (present) to 1980
- increase horizontal spatial resolution  $1^\circ$  (present) to  $1/6^\circ$ .
- include biogeochemical tracers and fluxes, including CO<sub>2</sub> fluxes
- provide uncertainty estimates for our solutions.
- increase the cadence and reduce the latency of new solutions
- add astronomical tidal forcing and gravitational attraction and loading

## Ocean/Cryosphere Coupling

- parameterize ocean melt of Greenland marine-terminating glaciers
- add time-varying freshwater fluxes from Greenland ice melt
- parameterize accumulation of “marine ice” within ice-shelf cavities
- create novel state estimates of time-evolving polar ice-sheets and ocean coupling

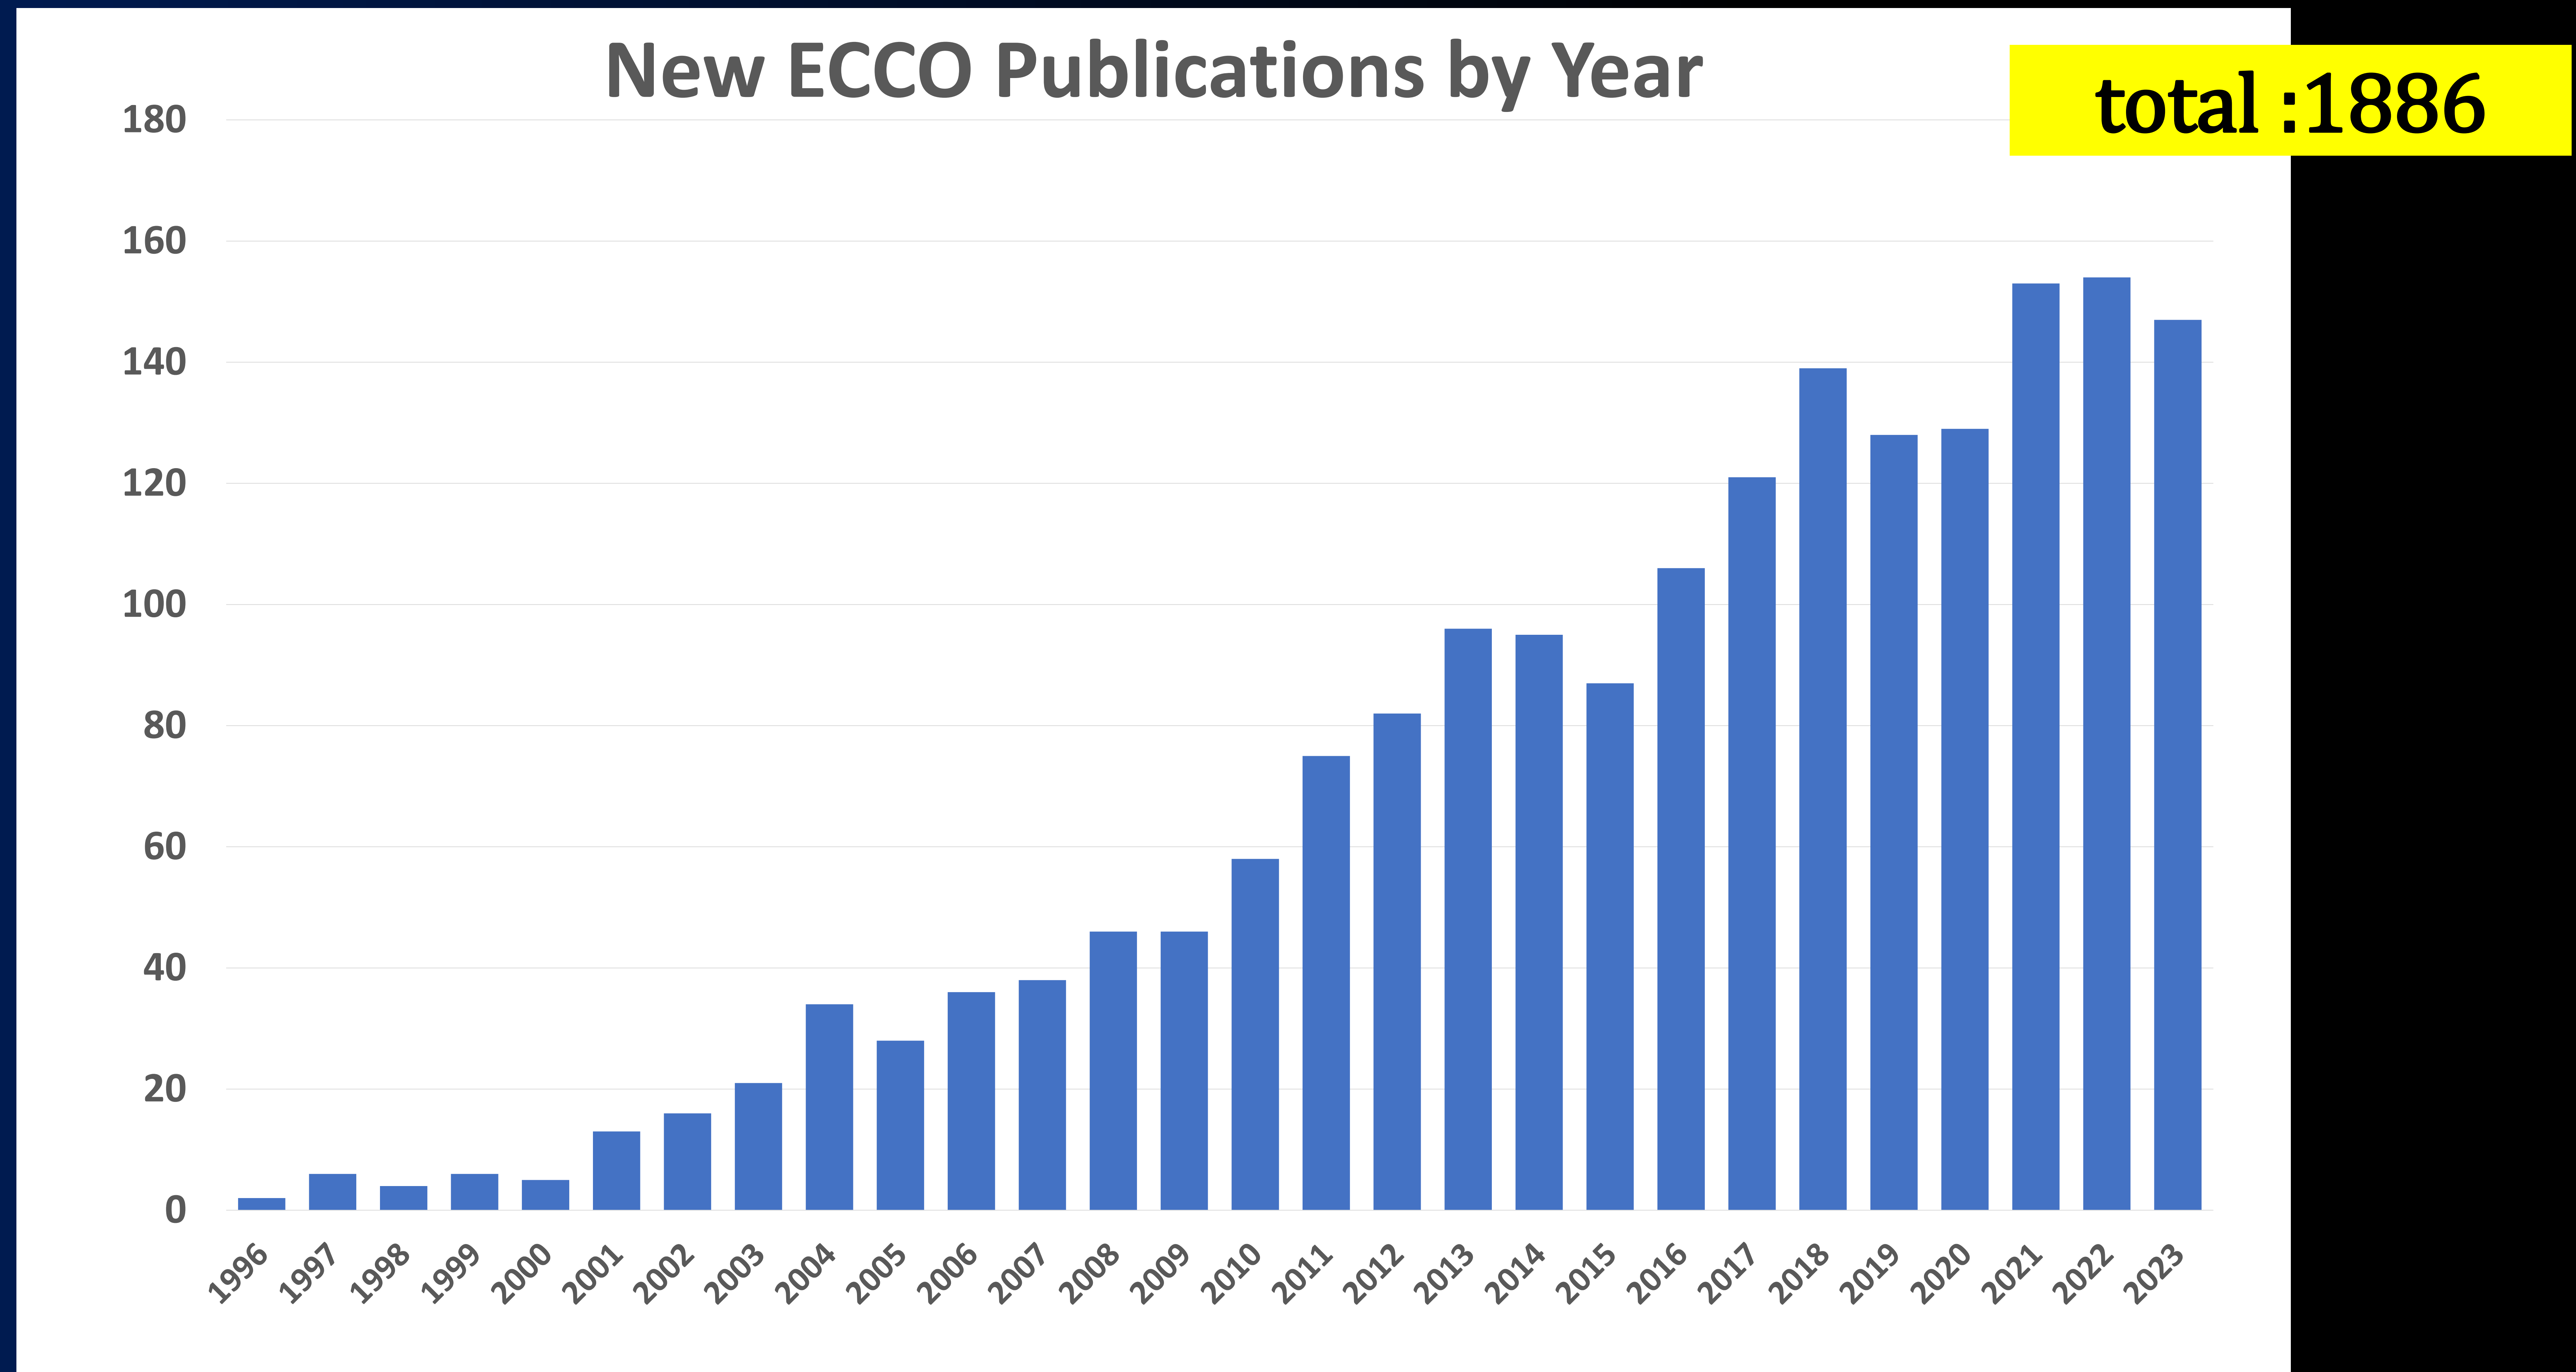

## Climate Prediction

- investigate how ECCO can contribute to S2S2D prediction using MITgcm/GEOS

## NASA Open Science: Transparent + Accessible + Inclusive + Reproducible

- continue development of online tutorials and code libraries
- add new high-level climate datasets for NASA public-facing websites
- develop new tools for analyzing the ECCO model and its adjoint
- host educational events to engage students, early-career scientists, and others.

# Rate of new ECCO publications continues to increase

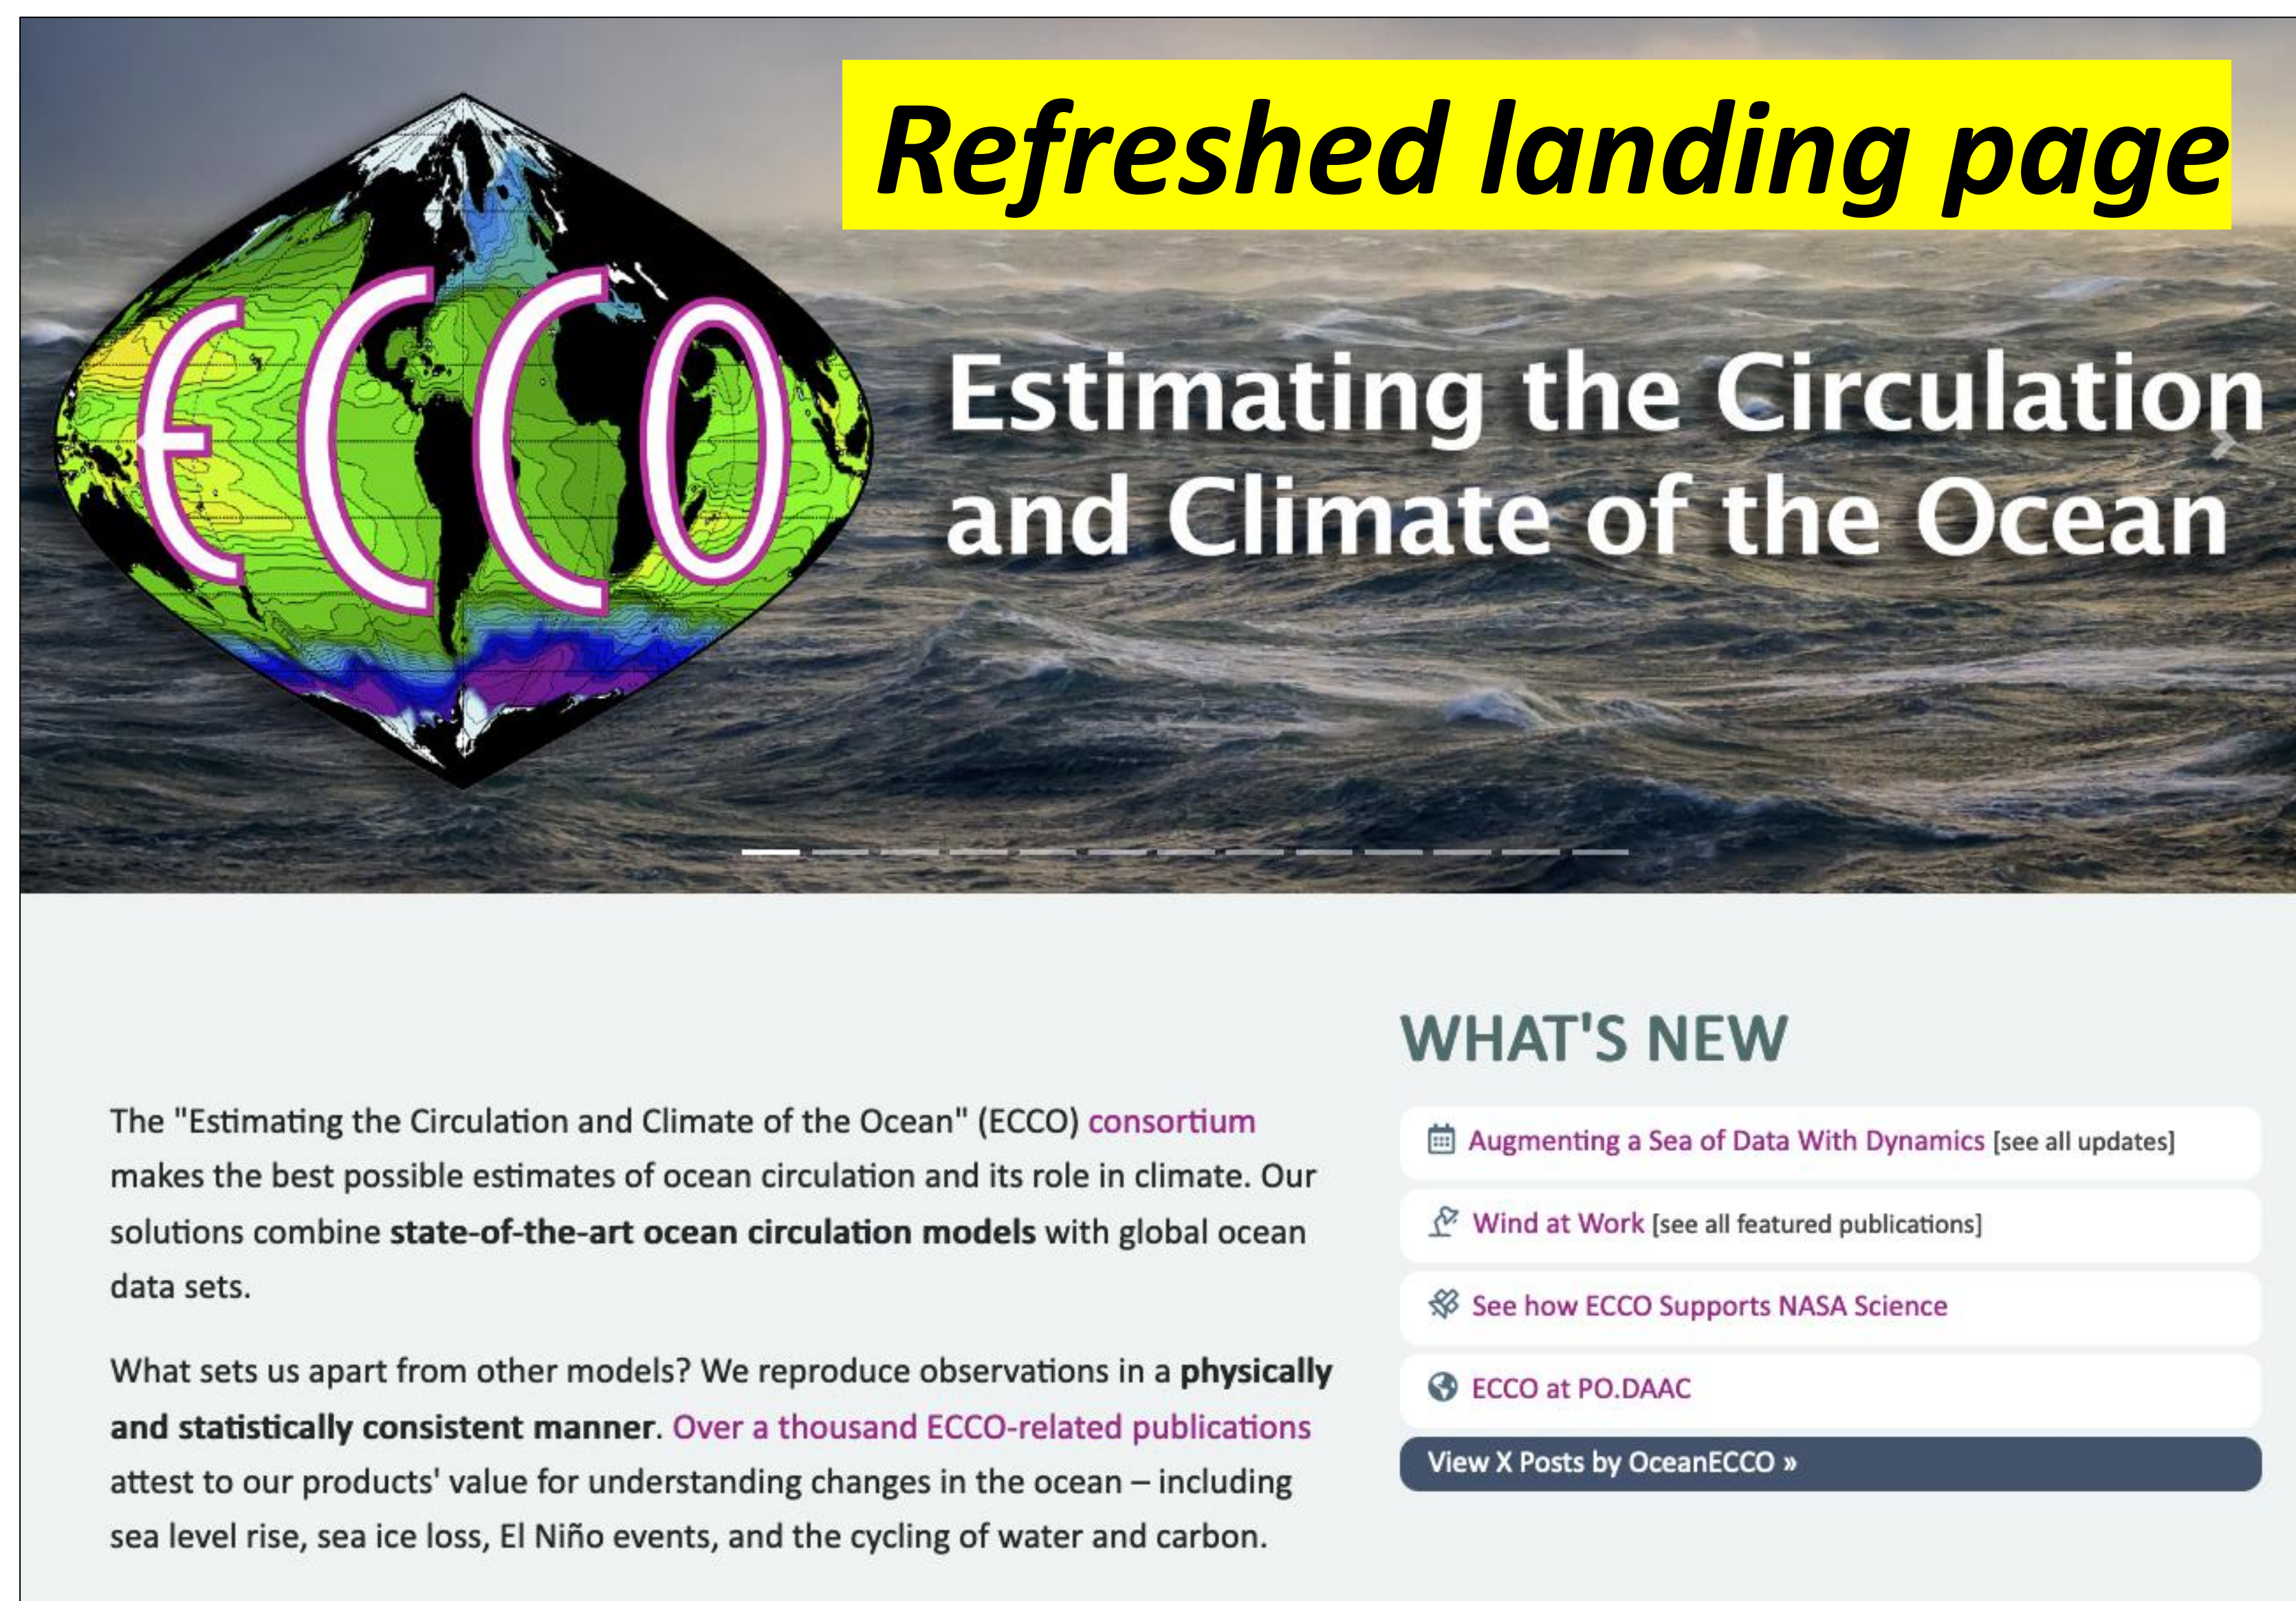

*ECCO is being used across an increasingly diverse range of research topics including ocean physics, geodesy, sea level and ocean mass variability, ocean temperature variability, meridional overturning, paleoclimate, coupled ocean/sea-ice; ocean/ice-sheet; and ocean/atmosphere interaction, and ocean biogeochemistry*

## Estimating the Circulation and Climate of the Ocean

The "Estimating the Circulation and Climate of the Ocean" (ECCO) consortium makes the best possible estimates of ocean circulation and its role in climate. Our solutions combine **state-of-the-art ocean circulation models** with global ocean data sets.

What sets us apart from other models? We reproduce observations in a **physically and statistically consistent manner**. Over a thousand ECCO-related publications attest to our products' value for understanding changes in the ocean – including sea level rise, sea ice loss, El Niño events, and the cycling of water and carbon.

- OT14B-1471 Extraction of the Ocean Circulation's Contribution to the Magnetic Field and Its Physical Oceanographic Applications
- PL13A-06 Using Data-Constrained Modeling to Examine the Drivers of Central Labrador Sea Oxygen Variability
- PL24A-2259 Deep Ocean Variability Forced by ENSO Cycles in the Eastern South Pacific
- PL24A-2268 Topography Effects on the Seasonal Variability of Ocean Bottom Pressure in the North Pacific Ocean and North Atlantic Ocean
- PL44A-2284 The origin and fate of Bering Strait throughflow
- PS11A-06 Ocean Eddy Splitting and the Associated Vertical Transport: Insights from Numerical Modeling
- PS23A-02 Understanding the Generation and Dynamics of Internal Tides in the Bay of Bengal using ECCO salinity and observations
- RH52A-06 What Forcing Mechanisms Affect the Co-variability of Interannual Sea Level Variations Between the Northeast and Southeast Coasts of the United States?
- RH53A-05 Identification of Forcing Mechanisms Driving Interannual Sea Level Variations along the US West Coast
- RH53A-06 Seasonal Forecasting of U.S. East Coast Sea Level Anomalies: Advantages Using a Global Simulation of Ocean-Dynamic Persistence

# ECCO Central Production Status

---

## ECCO Version 5

- Resolution: ~1/3 degree, 11c270 grid.
- Time period: 1992-2023 (for now)
- Method: multi-grid adjoint

## Goal

- Produce state estimates with higher resolution ocean models that are capable of explicitly resolving eddy mixing and other mesoscale processes

## Challenge

- Our conventional adjoint method is not computationally feasible for multi-decadal simulations with high resolution models that require small time steps.

## Solution

- Hybrid “multi-grid adjoint” approach: misfits are calculated on high-resolution forward simulation and adjoint gradients are calculated using an optimized “ECCO V4” model trajectory (e.g., V4r5).

## Current Status

- R&D in 2023 resulted in successful demonstration of the multi-grid adjoint approach for 11c270:11c90.
- We achieved model-data misfits that were **comparable** with our best 11c90 V4 solutions after < 10 iterations and **significantly improved** the existing “V5 alpha” solution
- Numerous technical challenges were identified and solved.
- Satellite and in-situ observations have all been updated through the end of 2023
- Atmosphere forcing (MERRA-2) has been downloaded and prepared for use in the 11c270 model (OI mapping)
- Ready to restart MG optimization
  - 1992-2023
  - V4r5 atmosphere adjustments + MERRA-2
  - V5 alpha optimized initial conditions and mixing parameters
  - All new observations

# ECCO “Quick-look” Extensions Status

---

## ECCO Version 4-EXT

- Resolution: ~1 degree, llc90 grid.
- Time period: 2020-2024 (for now)
- Method: apply climatology atmosphere adjustments

## Goal

- Regularly extend our state estimates to the present day with no more than 2 month lag for “quick-look” applications that require low-latency and can afford larger model-data misfits. Deliver high-level metrics to a special page on the ECCO website

## Challenge

- We have not traditionally worked in an operational mode so workflows need to be adjusted and automated to the extent possible.

## Solution

- Adjust workflow so that every month we now advance solutions forward in time and identify opportunities for automation

## Current Status

- New atmosphere forcing is now automatically downloaded every month
- Solution extended through the end of January 2024.
- Ocean biogeochemical tracers included in the solution (thanks to Hong and Dustin)
- Codes to calculate high-level metrics from the quick-look extension are in development
- Annette has prototyped a special section for the ECCO website to host high-level metrics
- Expect a first version will come online by mid-April
- Feedback welcome
